## Mixing of neutral mesons – explicitly

$$P(N^0 \rightarrow \bar{N}^0) \sim \left| \frac{q}{p} \right|^2 \left( \cosh \frac{\Delta\Gamma t}{2} - \cos \Delta m t \right)$$

$$P(\bar{N}^0 \rightarrow N^0) \sim \left| \frac{p}{q} \right|^2 \left( \cosh \frac{\Delta\Gamma t}{2} - \cos \Delta m t \right)$$

$$\text{CP-Violation: } \left| \frac{q}{p} \right| \neq 1 \iff P(N^0 \rightarrow \bar{N}^0) \neq P(\bar{N}^0 \rightarrow N^0)$$

Implementation: e.g.  $B^0 \bar{B}^0$ -pairs,  $\Delta\Gamma \approx 0$ ,  $\left| \frac{q}{p} \right| = 1$

# Mixing of neutral mesons – CP-Violation in interference

Example:  $B_d \rightarrow J/\Psi K_S$

- ▶  $\Im(\lambda_{f_{CP}}) = \sin(2\beta)$
- ▶ Simulated mistag fraction  $w = 0.2$
